# Equipment & Maintenance Overview

Equipment care belongs in the farm plan from the beginning. COAgri’s planned turnkey offering sources and installs machines; it does not manufacture them for the current release.

## 01 / Know what is installed

The planned equipment register will identify every installed machine, its role, location and installation history. Model specifications, required duty and commissioning results are separate facts. Replacing a machine must preserve the history of the position it serves.

## 02 / Agree care and responsibility

Define routine tasks, service intervals, ownership, parts support and who may perform the work. Calibration applies where a machine has a measurement that needs it. Project-specific requirements and support arrangements need approval; no response-time guarantee is implied.

## 03 / Record issues and return to service

The intended workflow records reported faults, downtime, maintenance and repairs. It will keep the evidence needed to decide when equipment can return to operation, including applicable cleaning, calibration and function checks. Manual reporting remains part of the planned core.

## 04 / Current development status

Equipment identity and planned-installation foundations exist in the software. Operational maintenance, readiness, downtime and return-to-service workflows are not released. Discovery will define the actual machine list and service rules before customer commissioning.

COAgri is in development. This draft is not a site design, service agreement or released operating procedure. Basis: COAgri project scope and discovery plan.
